## ASoft .NET Version Detector

The .NET Version Detector is a highly intuitive tool for easily checking for the installed .NET framework versions. One can easily check for any installed framework versions and download the corresponding SDK (for tools such as Visual Studio). This allows one to transfer the results to other programs quickly, ensuring a streamlined experience. .NET Runtime Runtime Environment for .NET Runtime Environment for .NET (RUNTIME) or .NET Framework for Windows is the collection of libraries that Microsoft has developed for .NET. The libraries consist of the core libraries and the libraries with a specific purpose, such as the XNA Game Studio library for the XNA Framework. All of the libraries can be downloaded from the official website of Microsoft. They were included in the original release of the .NET Framework 1.0. MSIL Code The Microsoft Intermediate Language (MSIL) is the executable code generated from the .NET Framework. This code consists of the machine-executable code (compiled CIL) and the metadata that the runtime places on the generated code. These metadata include the method signature (the method name, the parameter types, and the return type), additional class metadata (method, property and field definitions), the exceptions handled by the method, and the IL required to invoke the method, invoke the class constructor, and invoke the method that implements an interface. Many of these types are defined in the Common Language Infrastructure, which is an assembly-level programming language specification developed by Microsoft. MSIL code was the original native code produced by the CLR, and was documented in the documentation of the original .NET Framework 1.0 release. Some older MSIL code (for example, generated by the Mono development framework) does not have documentation available, and some new code (for example, that written for C# 7) is not documented. Binary Format Binary File Format (BFF) is a binary file format used for storing the metadata about the assemblies and their type information. The metadata is stored in the .NET Framework Binary File Format (BFF) file format. This format was designed by Microsoft to be a binary format for the .NET Framework. Most people may not realize that binary formats are superior to traditional ASCII text formats, due to their small file size and easiness of implementation. The BFF file format was introduced in the .NET Framework 1.0, where it was implemented in the MSIL code. Mono Mon

### What's New in the ASoft .NET Version Detector?

Check the .NET version is a utility for quickly determining if a currently installed version of the .NET framework version is the same as the one registered in the registry. Unlike other popular tools that detect the installed framework version, Check the .NET version shows a list of the installed Service Packs as well as the latest version of the .NET framework on the machine. Features: Check the .NET version supports all major .NET framework versions (from 1.0 up to 4.0). It's very easy to use and launch it simply by clicking the application icon. It is very lightweight, fast and supports multi-threading. It supports all editions of the .NET Framework, including Windows 7, 8 and Vista. It detects if a higher .NET version is installed, or if there are installed Service Packs. It can be very easily installed and transfers the .NET version and Service Packs to other .NET Framework applications. It automatically detects the .NET Framework version and Service Packs. How to uninstall the program: 1. Close all windows and applications. 2. Press "Start" and in the search box type "CMD" and hit the "Enter" key. 3. In the Command Prompt window, type the following commands: C:\>cd \Users\Public\Documents\ASoft C:\Users\Public\Documents\ASoft>devenv /uninstall C:\Users\Public\Documents\ASoft>devenv /Install Note: if you want to install on another directory, please use the path you specified.
